BGP Route Security
Cycling to the Future!

Alexander Azimov
Qrator Labs aa@qrator.net
WATCH OUT

WE GOT A DRAMA QUEEN OVER HERE
Malicious Hijacks/Leaks

- Fishing Sites
- Hijack of HTTPS Certificates
- Spam/Botnet Activity
- DOS Attacks
BGP Hijack Factory Shutdown

- 25 June – first report on NANOG mailing list;
- 30 June – disconnect from HE;
- 07 July – disconnect from IXes;
- 15 July – disconnect from Cogent;
- 23 July – disconnect from GTT;

Win!!!
BGP Hijack Factory Shutdown

• 25 June – first report on NANOG mailing list;
• 30 June – disconnect from HE;
• 07 July – disconnect from IXes;
• 15 July – disconnect from Cogent;
• 23 July – disconnect from GTT;

Win!!! But does it scale?
We are always inventing new bicycles!
IRR Filters

bgpq3 -S ripe as-qrator | head

IRR Filters

User Wins!

Route object (AS1, x.x.x.x)

Route: x.x.x.x
AS_PATH: AS4
IRR Filters: Bypassed

Attacker Wins!

Route Object (AS1, x.x.x.x)
Route object (AS4, x.x.x.x)

Route: x.x.x.x
AS_PATH: AS4
Key Findings: IRR Filters

IRR Filters Can be Used to:
• Filter *some mistake* hijacks;
• Filter *some mistake* route leaks.

IRR Filters Can’t be Used to:
• Filter malicious activity

In reality:
• Many AS-SETs are *poorly maintained*;
• *No filters* at some huge Tier-2 networks;
• Even some Tier1 networks fail to configure filters;

Source: https://ripe76.ripe.net/presentations/37-ripe76.azimov.pdf
IRRrrrrr!
ROA Validation

- Self-Signed “Root” Certificate
- IANA
- AFRINIC
- RIPE NCC
- ARIN
- APNIC
- LACNIC
- Issued Certificates Match Allocation Actions
- NIR1
- NIR2
- Resource Allocation Hierarchy
- ISP1
- ISP2
- ISP3
- ISP4
- ISP
- ISP
- ISP
ROA Validation (prefix, ASN)

1. Retrieve all cryptographically valid ROAs in a for selected *prefix*. This selection forms the set of *candidate ROAs*.

2. If the set of *candidate ROAs* is empty, then the procedure exits with an outcome of *unknown*.

3. If there is at least one candidate ROA where the AS number is *ASN* and prefix length less or equal to *max_length* option then the procedure exits with an outcome of *valid*.

4. Otherwise, the procedure exits with an outcome of *invalid*.
ROA Validation

User Wins!

Route: x.x.x.x
AS_PATH: AS4

ROA {x.x.x.x, AS1}
ROA Validation: Bypassed

Attacker Wins!

Route: x.x.x.x
AS_PATH: AS4 AS1

ROA {x.x.x.x, AS1}
Key Findings: ROA Validation

ROA Validation Can be Used to:
• filter mistake hijacks;

ROA Validation Can’t be Used to:
• filter route leaks;
• filter malicious hijacks.

In reality:
• Only 10% of prefixes are signed, transit ISPs doesn’t perform origin validations.
• There is progress at IXes!

Source: https://ripe76.ripe.net/presentations/37-ripe76.azimov.pdf
At least you have half of it!
BGPSec

**BGPSec Protocol Specification**

RFC 8205

AS_PATH Validation

User Wins!

ROA \{x.x.x.x, AS1\}  
(AS1, AS2) – signed  
(AS2, AS3) – signed  
(AS4, AS3) – signed

Route: x.x.x.x  
AS_PATH: AS4
AS_PATH Validation

User Wins!

Route: x.x.x.x
AS_PATH: AS4 AS1

ROA {x.x.x.x, AS1} (AS1, AS2) – signed
(AS2, AS3) – signed
(AS4, AS3) – signed
(AS1, AS4) – illegal
AS_PATH Validation: Bypassed

Attacker Wins!

Route: x.x.x.x
AS_PATH: AS4 AS1

ROA {x.x.x.x, AS1}
(AS1, AS2) – signed
(AS2, AS3) – signed
(AS4, AS3) – not signed
(AS1, AS4) – not signed
Key Findings: BGPSec

BGPSec can be used to:

• to detect malicious hijacks at high adoption rate!

In reality:

• Great computation cost;
• Vulnerable for downgrade attacks;
• Nobody is going to use BGPSec!
BGPSec: Unclear who is the rider
Before RPKI
Before BGPSec
There was soBGP
soBGP: Adjacencies

• ISP X publishes information about its connections;
• ISP Y publishes information about its connections;

If there are both pairs \((X,Y) \land \land (Y,X)\) – the pair becomes trustable!

If there is only one pair \((X,Y) \lor \lor (Y, X)\) the pair becomes... less trustable!
soBGP: Security Preference

- The pair is trustable: +A
- The pair is less trustable: -B

The route #1 has security preference: 2A – 3B
The route #2 has security preference: A – B
The route #3 has security preference: -2B

Which one is valid and which one is invalid?
soBGP: IXes

AS3 isn’t present in the AS_PATH

No adjacencies between AS1, AS2. Reject?!
Key Findings: soBGP

soBGP Can be Used to:
• Filter *bogon routes*;
• Create security metrics for routes;

soBGP Can’t be Used to:
• filter *route leaks*;

In reality:
• **Problems** with IXes;
• It’s a **rating function**, not a solution.
so-make-bgp-security-by-yourself
## BGP Quadrant

<table>
<thead>
<tr>
<th>Mistake</th>
<th>BGP Hijacks</th>
<th>BGP Route Leaks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mistake</td>
<td>IRR Filters; ROA;</td>
<td>IRR Filters; Route Leak Detection Draft Route Leak Mitigation Draft</td>
</tr>
<tr>
<td>Malicious</td>
<td>!</td>
<td>!</td>
</tr>
</tbody>
</table>
Are We Doomed for This?
Re-inventing Goals

• Stop propagation of (malicious) hijacks;
• Stop propagation of (malicious) route leaks;
• Incremental deployment;
• Lightweight – no significant changes in BGP!
• Automatiseret!
Anomaly Propagation
Anomaly Propagation

If we can stop propagation at the level of c2p and p2p – we are done!
A Beautiful Note

If valid route is received from customer or peer it MUST have only customer-to-provider pairs in its AS_PATH.

Then if we have a validated database of customer-to-provider pairs we will be able to verify routes received from customers and providers!
Autonomous System Provider Authorization

ASPA := {
  customer_asn – signer
  provider_asn – authorized to send routes to upper providers or peers
  AFI – IPv4 or IPv6
}

Pair Verification (AS1, AS2)

1. Retrieve all cryptographically valid ASPAs in a selected AFI with a customer value of AS1. This selection forms the set of candidate ASPAs.

2. If the set of candidate ASPAs is empty, then the procedure exits with an outcome of unknown.

3. If there is at least one candidate ASPA where the provider field is AS2, then the procedure exits with an outcome of valid.

4. Otherwise, the procedure exits with an outcome of invalid.
AS_PATH Verification

1. If the closest AS in the AS_PATH is not the receiver's neighbor ASN then procedure halts with the outcome "invalid";

2. If in one of AS_SEQ segments there is a pair (AS(I-1), AS(I)) is "invalid" then the procedure also halts with the outcome "invalid";

Route: x.x.x.x
AS_PATH: AS4

ROA {x.x.x.x, AS1}
ASPA {AS1, AS2}
ASPA {AS2, AS3}
ASPA {AS3, 0}
AS_PATH Verification

1. If the closest AS in the AS_PATH is not the receiver's neighbor ASN then procedure halts with the outcome "invalid";

2. If in one of AS_SEQ segments there is a pair (AS(I-1), AS(I)) is "invalid" then the procedure also halts with the outcome "invalid";

ROA {x.x.x.x, AS1}
ASPA {AS1, AS2}
ASPA {AS2, AS3}
ASPA {AS3, 0}

Route: x.x.x.x
AS_PATH: AS4 AS1
AS_PATH Verification

1. If the closest AS in the AS_PATH is not the receiver's neighbor ASN then procedure halts with the outcome "invalid";

2. If in one of AS_SEQ segments there is a pair (AS(I-1), AS(I)) is "invalid" then the procedure also halts with the outcome "invalid";

Route: x.x.x.x
AS_PATH: AS4 AS2 AS1

ROA {x.x.x.x, AS1}
ASPA {AS1, AS2}
**ASPA {AS2, AS3}**
ASPA {AS3, 0}
AS_PATH Verification

1. If the closest AS in the AS_PATH is not the receiver's neighbor ASN then procedure halts with the outcome "invalid";
2. If in one of AS_SEQ segments there is a pair (AS(I-1), AS(I)) is "invalid" then the procedure also halts with the outcome "invalid";

Route: x.x.x.x
AS_PATH: AS2 AS1

ROA {x.x.x.x, AS1}
ASPA {AS1, AS2}
ASPA {AS2, AS3}
ASPA {AS3, 0}
User always wins!
Summary

• ASPA – it’s simple, it scales;
• Works for both route leaks and hijack detection;
• Low computational cost;
• Doesn’t change the protocol itself;
• Works on existing RPKI infrastructure;
• Brings benefit at state of partial adoption.

BGP Security: Joint Effort

Want to get rid off BGP hijacks/leaks?

• Sign ROAs!
• Support ASPA at IETF mailing list;
• Support ASPA as RIR members!
• Make BGP great again!
Let’s make ASPA ASAP!
