SECURE HOME GATEWAY PROJECT

PROTOTYPE DEVELOPMENT
IoT SECURITY FOCUSED
IDEA & VISION
CHALLENGES

BUILDING A BETTER ONLINE CANADA Lead by:

Jacques Latour, CTO, CIRA Labs Canadian Internet Registration Authority Jacques.Latour [@] cira.ca October 218

Presented by: Michael Richardson

<mcr@sandelman.ca> (ASN 26227)

Today's home network and IoT products and solutions lack secure testing and design. Home network require active monitoring to mitigate the risks of attack.

home network = home and small business network

The home network of the future must be safe, private, secure and most of all easy to use.

The IETF HOMENET WG is making progress at making it easy to use

CIRA Labs - Secure Home Gateway - 2018-09

The Home network must be reachable from the internet seamlessly and securely

IPv6 makes connectivity to the home seamless and visible We must make it secure

CIRA Labs - Secure Home Gateway - 2018-09

The home network grows to include personal and wearable IoT, inside and outside the home...

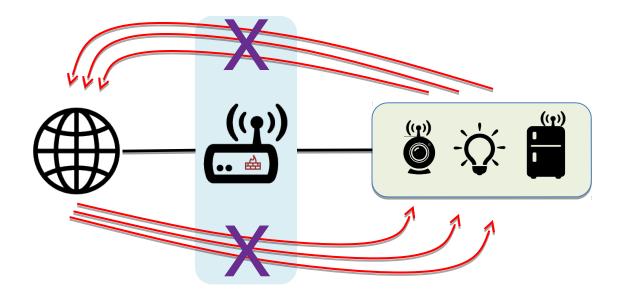

How did we get here?

- Our assessment of the home network and IoT security posture post MIRAI attack clearly identified a need for additional home security measures to protect the internet from compromised IoT devices and a very strong need for an enhanced open source home security framework.
- Our work so far has identified a significant gaps in open source projects to implement an enhanced home security framework
- We embarked on a journey to identify these gaps and start development of many open source projects to better the internet

Secure Home Gateway (SHG) Primary Project Goal

- The primary goal of this project is to develop a secure home gateway that;
 - protects the internet from IoT devices attacks and
 - protects home IoT devices from the internet attacks

Scope of Work and Goals

- We are developing an advanced security framework for small network (home and small business) gateways based on integrating existing and emerging technologies & standards
- Goals:
 - Develop a functional SHG prototype
 - Develop a simple management interface to provision complex network
 - Identify new standards requirements and updates
 - To enhance small network privacy & security with 'intent based' network access controls
 - To have open source running code & standards
 - Develop a framework to provision SHG domain names

Why are we working on this? -> Risk mitigation

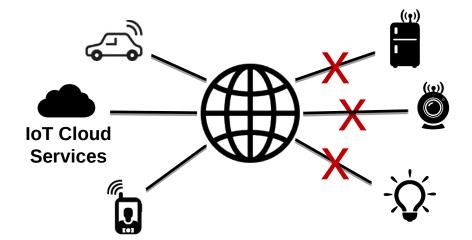

- For many internet organizations like CIRA the #1 risk on the risk register is a large scale (Dyn like) DDoS attack.
- One of the mitigation mechanisms for this risk is to prevent 'weaponization' of IoT devices
- Tightly controlling access 'to' and 'from' IoT devices inside the home or small office network is key to preventing 'weaponization' and causing harm on the internet.
- The threat that IoT devices bring is the scale of attacks. The uncontrolled access of million/billions of IoT devices to and from the internet is the threat we need to mitigate.

Overview of the IoT threat landscape -> Scale and capacity

- IoT device compromises:
 - Used in internet attacks i.e. MIRAI/DYN Attack (DDoS) targeting DNS servers (~1.2 Tbs)
- IoT traffic generation, reflection and amplification
 - IoT device used various attacks (DDoS) NTP, DNS, SNMP and new vectors.
 - IoT device have the capacity to generate large traffic load
 - Home and small office network now starting to have gigabit internet access speed, significantly impacting the capacity to create powerful attacks

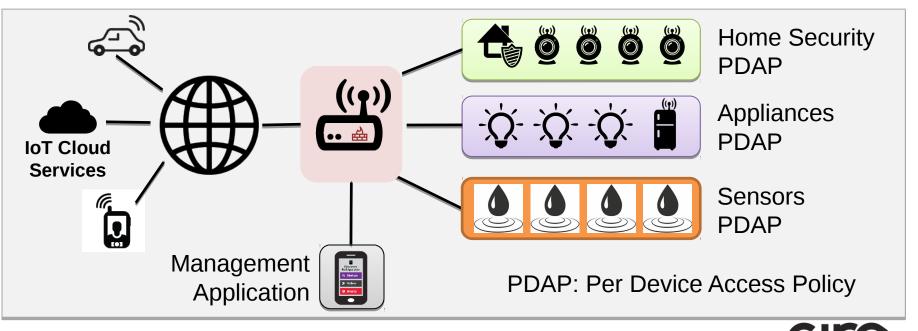

How can we protect IoT devices? -> Common sense

- "Don't even think of connecting an IoT device directly on the internet"
- Always place IoT device behind a gateway / firewall
- Don't allow remote access to an IoT device

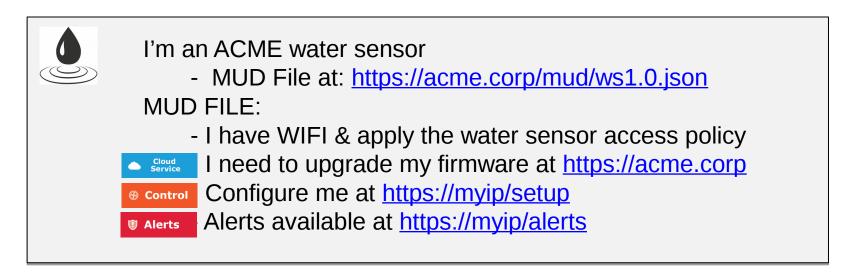

How can we protect IoT devices? -> Best practice & new standards

- Rule #1: Identify IoT devices on your home network
- Rule #2: Place a policy around the IoT device that restricts it to a specific function (default is no access)
- Rule #3: Monitor for behavioural changes in the device and quarantine at the first sign of change.

How do we provision new IoT devices? -> Application of emerging standards

- The IETF is working on a Manufacturer Usage Description (MUD) specification to help with IoT device provisioning and automated network access control configuration.
 - <u>https://datatracker.ietf.org/doc/draft-ietf-opsawg-mud</u>

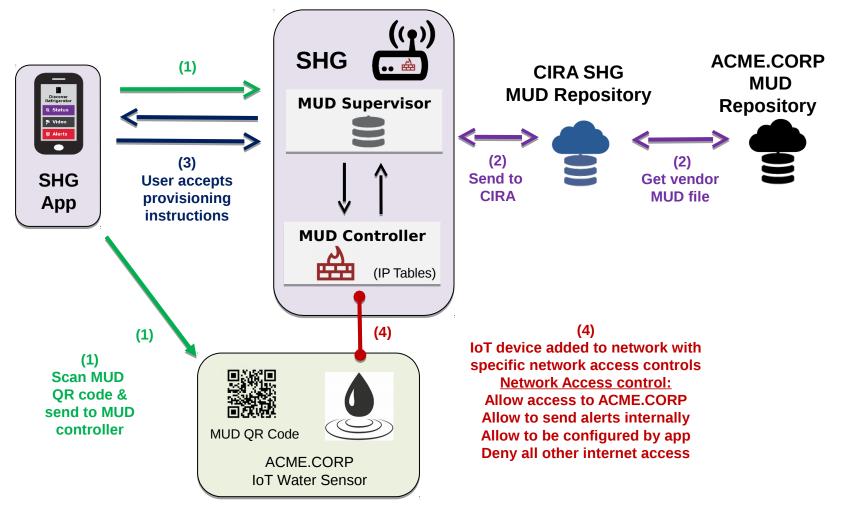

Manufacturer Usage Description (MUD) -> A unique device identifier (label)

- The MUD file content would be available on the vendor's web site (model type and firmware version)
 - https://acme.corp/mud/water-sensor-1.0.json
- The MUD file URL would be available on the IoT device as a QR code or as a network parameter

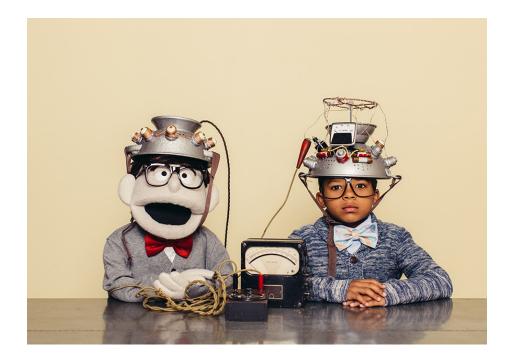

• It would be nice if the IoT device could advertise it's current firmware version and/or current MUD file URL via WIFI or network connection (DPP, DHCP, LLDP...) on order to setup correct security profile

High Level MUD & IoT Device Provisioning Workflow

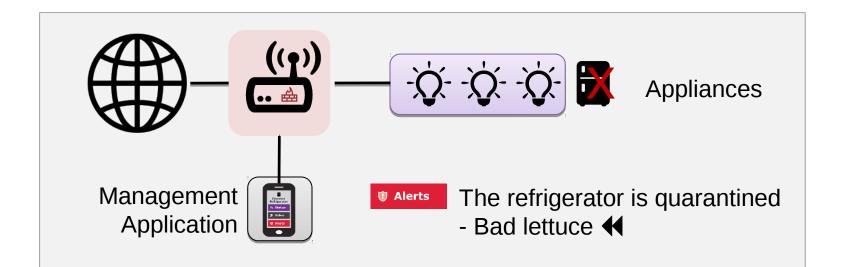

CIra

You guess it! That's why we need a simple provisioning interface this stuff is complex!

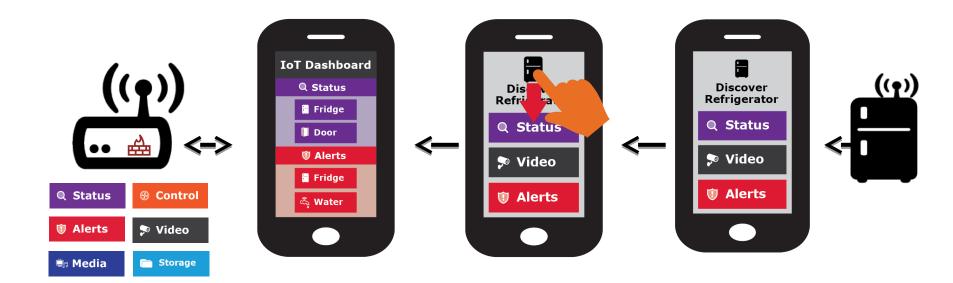

Quarantine of compromised devices -> Behavioural analysis

 The policy part of the MUD profile is created to provide an additional level of protection for the network. This ensures the device will function only as intended and once behavioural changes are noted then the device is logically segregated from the network (quarantine)

Simple user interface is key to this project: Swipe UP, DOWN, LEFT and RIGHT

• Gateway provisioning, device discovery, device provisioning must be as simple as possible, intuitive for non experienced users, available as framework for default open source app.

We are building a Prototype -> Based on Omnia Turris Gateway

- Develop a Proof of Concept and prototype
 - Using .CZ Omnia Home Gateway & openWRT
 - IoT device provisioning based on MUD
 - Home Gateway App (Android/iPhone)
 - Develop some IoT discoverable devices and MUD profiles
- Use public GitHub to document the functional specification and repo for prototype software
 - Functional specification (Work in progress)
 - Open source software repository
 - <u>https://github.com/CIRALabs/Secure-IoT-Home-Gateway</u>

Specifications we are currently leveraging

Specifications we are leveraging:

- https://datatracker.ietf.org/doc/draft-ietf-opsawg-mud/
- https://datatracker.ietf.org/doc/draft-ietf-netmod-acl-model
- RFC 7368
- RFC 8375
- https://datatracker.ietf.org/doc/draft-ietf-homenet-simple-naming
- https://datatracker.ietf.org/doc/draft-ietf-homenet-front-end-naming-delegation
- RFC 4033,4034,4035 (DNSSEC)
- https://datatracker.ietf.org/doc/rfc5011/
- RFC 4795

Specifications we are planning/considering:

- RFC4301, RFC7296 (IPsec. Considering OpenVPN too)
- RFC8366, https://datatracker.ietf.org/doc/draft-ietf-anima-bootstrapping-keyinfra/
- https://datatracker.ietf.org/doc/draft-cheshire-dnssd-roadmap/
- https://datatracker.ietf.org/doc/draft-ietf-dnssd-hybrid/
- https://datatracker.ietf.org/doc/draft-cheshire-dnssd-roadmap/
- https://datatracker.ietf.org/doc/draft-ietf-dnssd-mdns-relay/

Specifications we are writing:

- draft-richardson-opsawg-securehomegateway-mud-00
- How we are using, extending, MUD.
- draft-richardson-anima-smartpledge-00
- How we will leverage a DPP-like QR code to do initial enrollment of the *ROUTER*

CILO

What do you think?
